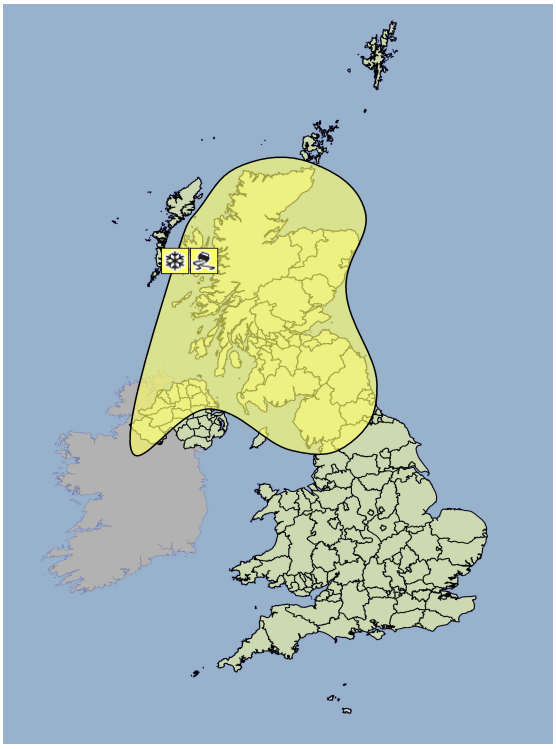
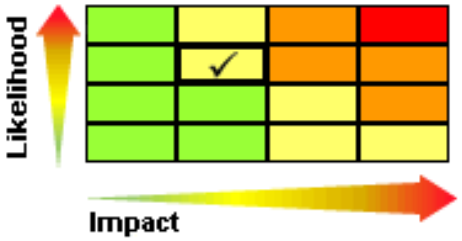
National Severe Weather Warning Service





Chief Forecasters Assessment
A deep depression passing close to the north of Scotland will pull cold air across the northern parts of the UK as it passes, allowing the frequent showers to fall as sleet or snow in many parts. Near western coasts rain may predominate, although this increases the ice risk as road temperatures fall below zero. Hail and lightning are also likely to be hazards here.

The colder air will extend further south during Tuesday with snow falling to progressively lower levels across northern England. On Tuesday night a more organised area of showery precipitation is likely to affect Scotland, which has the potential to produce several centimetres of snow at low levels, including the Central Belt, though details of this are rather uncertain at present. Ice is also likely to be a hazard again on Tuesday night.

This warning will be reviewed and updated on Tuesday.

The Met Office have issued a **Yellow Warning** of **Snow and Ice**

Valid from **18:00 on Mon, 12th Jan 2015** until **12:00 on Wed, 14th Jan 2015**

Frequent showers of sleet or snow will affect Scotland and Northern Ireland from Monday evening into Tuesday. Accumulations of 2-4 cm of snow are likely above about 100 m, but also to low levels locally, and more widely over the northern half of Scotland, where more than 10 cm is likely above 300 m. Icy patches are likely to develop from early this evening. Hail and lightning will be additional hazards, especially close to western coasts.

During Tuesday the risk of snow extends into northern England, especially across the Pennines and higher parts of Cumbria. Meanwhile, a more persistent spell of sleet and snow may settle at low levels across Scotland on Tuesday night and into Wednesday
